

Eliminate phishing attacks outside your network

Right now, countless phishing attacks are speeding toward you. In the past you had to passively wait until they got inside your perimeter, then do damage control.

Stop phishing campaigns at the earliest attack cycle stages

Now Area 1 Horizon™ aggressively extends to the attacker's edge, to track, pursue, and disrupt phishing delivery mechanisms in their formative stages. So they never even arrive.

- Inline email inspection to detect and halt incoming phishing emails, whether spear-phishing, whaling, spoofing, BEC or others
- ActiveSensors™ monitor phish, exposing their methods, techniques, and infrastructure
- Integrates easily with your own anti-spam filters, policy and quarantine setup

Horizon's unprecedented visibility disables emerging threats before they reach your perimeter.
